

Vulnerability Assessment and Penetration Testing Services

CONDUCT SIMULATED ATTACKS & PRIORITIZE REMEDIATING POTENTIAL RISKS

How We Can Help

A comprehensive threat and vulnerability analysis is crucial to protecting your organizational data and business assets. Vulnerability Assessment and Penetration Testing (VAPT) is a full-fledged diagnosis of your web applications, network, and software that helps you ensure your infrastructure security.

At Grazitti, our VAPT professionals follow a multidisciplinary approach to detect vulnerabilities in your business network and devise ways to mitigate them. In order to take corrective action to protect your confidential data, our team sticks to a step-by-step process given below:

1 Planning & Scoping

Determine the scope of VAPT for analyzing web application vulnerabilities

2 Security Assessment

Identify actual and potential security threats in web applications

3 Vulnerability Exploitation

Verify the means that hackers could use to cause malicious activity

4 Interim Reporting

Prepare an interim report based on vulnerabilities identified and exploited

5 Vulnerability Remediation

Suggest recommendations and remediation steps to fix reported vulnerabilities

6 Final Reporting

Report the final status of vulnerabilities post remediation and re-assessment

Our Vulnerability Assessment and Penetration Testing Services

- **Dynamic Application Security Test:** A black-box testing technique conducted to simulate automated attacks and help you detect vulnerabilities in a running application.
- **Static Application Security Test:** A white-box testing methodology that enables you to analyze source code and find vulnerabilities during the initial stages of development.
- **Security Configuration Check:** Get a comprehensive analysis of potential misconfigurations in systems and set up parameters to protect the data against sophisticated and targeted attacks.
- **Admin Security Health Check:** Run a health check on your admin security settings to determine potential vulnerabilities and find out how secure your business network is.
- **Penetration Testing:** Simulate real-world attacks on your networks, applications, or devices, and determine the level of security maintained for your key infrastructure.
